

R.C.B.S. ROCKCHUCKER CONVERSION TO SWAGING PRESS

The R.C.B.S. Rockchucker conversion kit consists of a modified ram for swaging, and punch holder and ejector pen (see picture). One hole must be drilled in the base of the press for the injector pen. We will supply a jig and drill for you to drill the hole yourself or we will be glad to do it for you.

The advantages to this system are:

1. Like the B.S.S.P. press, you can eject your work on the upstroke of the handle. This conserves both time and effort in swaging.
2. The dies used in the R.C.B.S. conversion are the same dies used in the B.S.S.P. System, so if you decide later to get a B.S.S.P. press you can use the same dies. Only the internal punch for the point form die has to be changed. The Cost of the punch is \$25.00. Most other modifications and a 7/8 x 14 die set will not work in the B.S.S.P. and vice versa.
3. The conversion from reloading press to swaging press only takes a short time, (about 2 minutes) and conversion back is just as fast.

If you have a reloading press you would like to convert to swage bullets, let us know, and we will look into the possibilities of doing it for you.

We will supply a jig and drill bit for drilling the hole in your press (\$10.00 deposit returned when the jig is returned.) All you need is a 1/4" hand drill.

If you have been wanting to get into swaging for a long time, now it is simple, easy and works great.

P.S. Rockchucker presses manufactured after 1982 take a smaller ram. Please let me know if your press is pre or post 1982
